### Notes:

1. TX\_Fault is an open collector/drain output, which should be pulled up with a 4.7K-10K $\Omega$  resistor on the host board. Pull up voltage between 2.0V and  $V_{ccT}/R+0.3V$ . When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
2. TX\_Disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7-10 K $\Omega$  resistor.
3. SDA and SCL should be pulled up with a 4.7K- 10K $\Omega$  resistor on the host board.
4. LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with a 4.7K - 10K $\Omega$  resistor. Pull up voltage between 2.0V and  $V_{ccT}/R+0.3V$ . When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.8V
5. The module signal ground contacts, VeeR and VeeT, should be isolated from the module case
6. RD-/+ : These are the differential receiver outputs. They are AC coupled 100 $\Omega$  differential lines which should be terminated with 100 $\Omega$  (differential) at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board.
7. TD-/+ : These are the differential transmitter inputs. They are AC-coupled, differential lines with 100 $\Omega$  differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board.
